Technical specifications

PCIe® specifications

The primary I/O bus for the main board is PCIe Gen2. The following table lists the characteristics of the PCI-E bus segments. Details about each bus segment follow the table.

NOTE: The signaling bit rate of PCI Express is 2.5Gbit/s one direction per lane for Gen 1 and 5.0Gbit/s one direction per lane for Gen 2.

Expansion slot	Number	Type	Bus width[1]	Voltage	Connector	Location	Form factor
PCIe x16	1	PCIe Gen2	x16	3.3V	x16	Riser	Low-profile

NOTE:

1. Indicates the number of physical electrical lanes running to a PCIe® connector.

2. Default bus assignment (in decimal). Inserting cards with PCI™ bridges may alter the actual bus assignment number.

3. Slots are enumerated differently based on the operating system. Microsoft® operating systems enumerate Device ID by bus starting from the lowest bus to the highest.

* support depends on 8GB DIMM available

Mirroring mode:

- For mirroring mode, the memory contains a primary image and a copy of the primary image. Therefore, the effective size of memory is reduced by at least one-half.

- Follow the population rules described in independent mode.

- Mirroring mode needs the channel 1 & channel 2 with identical DIMM. DIMM slot populations within a channel do not have to be identical but the same DIMM slot location across channel 1 and channel 2 must be the same. DIMM1A and DIMM2A should be the same type, size and manufacturer. DIMM1B and DIMM2B memory should be the same type, size and manufacturer. DIMM1C and DIMM2C memory should be the same type, size and manufacturer.

- Same rule is applied to the CPU2.

- Please refer to the User Guide for complete population for both single and dual processor configurations.

Lockstep mode:

- In Lockstep Channel Mode, each memory access is a 128-bit data access that spans Channel 1 and Channel 2. This is done to support SDDC for DRAM devices with 8-bit wide data ports. The same address is used on both channels such that an address error on any channel is detectable by bad ECC. Lockstep Channel mode is the only RAS mode that supports x8 SDDC.

- Follow the population rules described in independent mode.

- Lockstep mode needs the channel 1 & channel 2 with identical DIMM. DIMM slot populations within a channel do not have to be identical but the same DIMM slot location across channel 1 and channel 2 must be the same. DIMM1A and DIMM2A should be the same type, size and manufacturer. DIMM1B and DIMM2B memory should be the same type, size and manufacturer. DIMM1C and DIMM2C memory should be the same type, size and manufacturer.

- Same rule is applied to the CPU2.

- Please refer to the User Guide for complete population for both single and dual processor configurations.

.

Sparing mode:

- In this mode, if system detects degrading memory and system still not crash, the data in failed channel will be copied to spare channel. Failed channel is then isolated and spare channel becomes active. But if any uncorrectable error happens before the isolation, it will still cause the system stop normal operation.

- Follow the population rules described in independent mode.

- Sparing mode need all three channels with identical DIMMs. 1A, 2A and 3A should be the same type, size and manufacturer. 1B, 2B and 3B memory should be the same type, size and manufacturer. Same rule is applied to CPU2.

- Memory sparing mode is only supported by Intel Xeon 5600 series processor. Intel Xeon 5500 series processor **does NOT support the memory sparing mode.**

- Please refer to the User Guide for complete population for both single and dual processor configurations.

Memory Identification

Generally, there are some memory information printed on the label of DIMM, but different vendor may have different format. For example:

  4GB 2Rx4 PC3-10600R xx xx xxx

1. Density

  ▪ 1GB, 2GB, 4GB, 8GB

2. Rank

  ▪ 1R = Single Rank

  ▪ 2R = Dual Rank

  ▪ 4R = Quad Rank

  ▪ Note: if any quad rank DIMM is used, maximum only 2 DIMM per channel can be supported

3. Bit Organization

  ▪ This platform supports x4 and x8

  ▪ Note: It's not recommend to mix DIMM with different bit organization in one system

4. Speed

  ▪ PC3 – 6400 => DDR3- 800

  ▪ PC3 – 8500 => DDR3- 1066

  ▪ PC3 – 10600 => DDR3- 1333
